1. The first group of variables includes the demographic characteristics of the respondents, such as age, gender, and education level. These variables are used to control for potential confounding factors that may influence the dependent variable.

2. The second group of variables represents the independent variables, which are the factors hypothesized to have a direct effect on the dependent variable. These variables are measured using standardized scales to ensure consistency and reliability.

3. The third group of variables consists of control variables, which are used to account for other factors that may influence the dependent variable but are not the primary focus of the study. These variables are included to improve the internal validity of the research.

4. The final group of variables includes the dependent variable, which is the outcome of interest that the study aims to explain or predict. This variable is measured using a validated scale that has been used in previous research.

Figure 6. The effect of the number of iterations on the accuracy of the proposed algorithm. The figure shows two plots side-by-side. The left plot shows the accuracy of the proposed algorithm (in %) versus the number of iterations (from 0 to 100). The right plot shows the accuracy of the proposed algorithm (in %) versus the number of iterations (from 0 to 100).
